MissionOS Supporting Acciona Wind Farm Project

The San Gabriel Wind Farm of Acciona Energía Chile SpA implemented MissionOS for their monitoring movements of the wind turbines.

In order to innovate in a remote monitoring system for deformations, displacements and settlements, Acciona Energía has requested Topoland to install remote and wireless condition monitoring that includes maintaining a preventive alert system in real-time for risk events, identifying trends, producing weekly and monthly reports, and maintain remote access to our data visualisation platform to interested parties. This solution will allow San Gabriel to monitor the vertical towers and base structure in real-time, along with storing and generating of resources that will allow the analysis of the database to be presented in a clear and precise way.

The bespoke MissionOS platform is a highly configurable data platform designed specifically for the entire construction management process providing quality data in real-time. Environmental performance can be enhanced through the use of CCTV, Events Blogging & Measurements, Configurable Monitoring Models and Materials Management.
